

How is this class different
than COP 3223?

- ① We will CARE about the efficiency of a solution!
(how fast)
- ② For grading consistency, we will use Eustis for compiling + running programs.
- ③ Learn some math to analyze + predict how fast a program will run.

Sorted List Matching Problem

Given 2 separate sorted lists, find all values ~~that~~ that appear in both lists.

List 1: 6, 8, 9, 15, 22, 27, 33, 81, 89 n

List 2: 2, 3, 6, 12, 14, 27, 29 m ~~1000~~

```

for (int i = 0 ; i < n ; i++) {
    int found = 0;
    for (int j = 0 ; j < m ; j++)
        if (list1[i] == list2[j])
            found = 1;
    if (found) printf("%d\n", list1[i]);
}

```

repeats m times

repeats n times

Runtime = $O(mn)$

8/23/21 (3)

Sec 2

List 1: 6, 8, 9, 15, 22, 27, 33, 81, 89 n List 2: 2, 3, 6, 12, 14, 27, 29 m

Middle Solution: 6

For each number in list 1,
search to see if it's in list 2,
but use the fact that list 2 is
sorted to speed up the search.

Binary Search in a sorted array

Sec 2

Input: Sorted Array, and a search value

Output: Is the value in the array?

0 1 2 3 4 5 6 7 8 9
2, 3, 6, 8, 12, 27, 33, 42, 91, 202
low search val: 91 high

$$mid = (low + high) / 2; \quad (4)$$

Since $91 > 12$, low = 5

$$m_d = (5+9)/2 = 7$$

Since $91 > 42$, $low = 8$

Since $11 \in (2, 100)$ & $11 \neq 8$
 $mid = (8+9)/2 = 8$ FOUND IT!

for each item in list l

binary search if it's in list 2

Run time binary search on n elements
is $O(\lg n)$ This algorithm takes
 $O(n \lg m)$

i
↓

List 1: 6, 8, 9, 15, 22, 27, 33, 81, 89

List 2: 2, 3, 6, 12, 14, 27, 29
↑
j

```
int i = 0, j = 0;
while (i < n && j < m) {
    if (list1[i] < list2[j]) i++;
    else if (list2[j] < list1[i]) j++;
    else {
        printf("%d\n", list1[i]);
        i++;
        j++;
    }
}
```

Runtime = $O(n+m)$

n	m	nm	n+m
100	100	10,000	200
10^6	10^5	10^{11}	$1,100,000 = 1.1 \times 10^6$
